Institute Vision and Mission

VISION

To be one of the Nation's premier Engineering Colleges by achieving the highest order of excellence in Teaching and Research.

MISSION

- To foster intellectual curiosity, pursuit and dissemination of knowledge.
- To explore students' potential through academic freedom and integrity.
- To promote technical mastery and nurture skilled professionals to face competition in ever increasing complex world.

DEPARTMENT OF INFORMATION TECHNOLOGY

VISION

To become a nationally recognized quality education center in the domain of Computer Science and Information Technology through teaching, training, learning, research and consultancy.

MISSION

- The Department offers undergraduate program in Information Technology to produce high quality information technologists and software engineers by disseminating knowledge through contemporary curriculum, competent faculty and adopting effective teaching-learning methodologies.
- Igniting passion among students for research and innovation by exposing them to real time systems and problems
- Developing technical and life skills in diverse community of students with modern training methods to solve problems in Software Industry.
- Inculcating values to practice engineering in adherence to code of ethics in multicultural and multi discipline teams.

PROGRAM EDUCATIONAL OBJECTIVES

After few years of graduation, the graduates of B. Tech. (IT) Program will be:

1. Enrolled or completed higher education in the core or allied areas of Computer Science and Information Technology or management.
2. Successful entrepreneurial or technical career in the core or allied areas of Computer Science and Information Technology.
3. Continued to learn and to adapt to the world of constantly evolving technologies in the core or allied areas of Computer Science and Information Technology.

PROGRAM OUTCOMES

On successful completion of the Program, the graduates of B. Tech. (IT) Program will be able to:

1. Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
2. Identify, formulate, research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.

3. Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
4. Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
5. Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
6. Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
7. Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
8. Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
9. Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
10. Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
11. Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
12. Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

PROGRAM SPECIFIC OUTCOMES

On successful completion of the program, the graduates of B.Tech. (IT) program will be able to:

- PSO1:** Design and develop database systems, apply data analytics techniques, and use advanced databases for data storage, processing and retrieval.
- PSO2:** Apply network security techniques and tools for the development of highly secure systems.
- PSO3:** Analyze, design and develop efficient algorithms and software applications to deploy in secure environment to support contemporary services using programming languages, tools and technologies.
- PSO4:** Apply concepts of computer vision and artificial intelligent for the development of efficient intelligent systems and applications.

ABSTRACT

The Online Shopping is a web-based application intended for online retailers. The main objective of this application is to make it interactive and its ease of use. It would make searching, viewing and selection of a product easier. It contains a sophisticated search engine for user's to search for products specific to their needs. The search engine provides an easy and convenient way to search for products where a user can Search for a product interactively and the search engine would refine the products available based on the user's input. The user can then view the complete specification of each product. They can also view the product reviews and also write their own reviews. The application also provides a drag and drop feature so that a user can add a product to the shopping cart by dragging the item in to the shopping cart. The main emphasis lies in providing a user-friendly search engine for effectively showing the desired results and its drag and drop behavior.

INTRODUCTION

Shopping has long been considered a recreational activity by many. Shopping online is no exception. The goal of this application is to develop a web based interface for online retailers. The system would be easy to use and hence make the shopping experience pleasant for the users. The goal of this application is to develop an easy to use web based interface where users can search for products, view a complete description of the products and order the products.

- A search engine that provides an easy and convenient way to search for products specific to their needs. The search engine would list a set of products based on the search term and the user can further filter the list based on various parameters.

- An AJAX enabled website with the latest AJAX controls giving attractive and interactive look to the web pages and prevents the annoying post backs.

- Drag and Drop feature which would allow the users to add a product to or remove a product from the shopping cart by dragging the product in to the shopping cart or out of the shopping cart.

- A user can view the complete specification of the product along with various images and also view the customer reviews of the product. They can also write their own reviews.

Structured query language (SQL) is a programming language for storing and processing information in a relational database. A relational database stores information in tabular form, with rows and columns representing different data attributes and the various relationships between the data values.

WHY IS SQL IMPORTANT:

Structured query language (SQL) is a popular query language that is frequently used in all types of applications. Data analysts and developers learn and use SQL because it integrates well with different programming languages. For example, they can embed SQL queries with the Java programming language to build high-performing data processing applications with major SQL database systems such as Oracle or MS SQL Server. SQL is also fairly easy to learn as it uses common English keywords in its statements

How SQL Works?

SQL Query Engine, etc When you are executing an SQL command for any RDBMS, the system determines the best way to carry out your request and SQL engine figures out how to interpret the task included in this process.

These components are –

- Classic Query Engine
- Optimization.
- There are various components Engine
- Query Dispatcher

Types of SQL Statements

The tables in the following sections provide a functional summary of SQL statements and are divided into these categories:

- Data Definition Language (DDL) Statements
- Data Manipulation Language (DML) Statements
- Transaction Control Statements
- Session Control Statements
- System Control Statement
- Embedded SQL Statements

An online shopping system is a process in which people (specific customers) are being provided with the option of purchasing goods and services directly from the seller, all in a real-time environment. Online shopping is an application of the internet as electronic commerce. From the business perspective, customers usually find the products more attractive, on websites, as they get all the details available there.

People in large number are doing online shopping today, and it is not only because it is convenient as one can shop from home, but also because there is an ample number of varieties available, with a high competition of prices, and also it is easy to navigate for searching regarding any particular item.

This system involves its own database to be maintained. As the information or details about the products are stored in the database the server-side functionalities. The Server process is for dealing with the customer's detail and the items that are shipped to different locations based on the addresses provided by the customers.

trends.com	trens	722239

PRODUCT CATEGORY

Creation

SQL> create table p_category(p_id number not null,p_quantitynumber,p_type varchar2(9));
Table created.

SQL> desc p_category

Name	Null?	Type
P_ID	NOT NULL	NUMBER
P_QUANTITY		NUMBER
P_TYPE		VARCHAR2(9)

Insertion

SQL> insert into p_category(p_id,p_quantity,p_type)values(123,'12bags','food');
1 row created.

SQL> select*from p_category;

P_ID	P_QUANTITY	P_TYPE
123	12bags	food
143	11bags	candy
183	51bags	rice

103 5bags pulses
113 9sheets shampoo

WORKS_IN

```
SQL> create table works_IN(admin_id number,w_url varchar2(10),primary key(admin_id,w_url),  
foreign key(admin_id) references admin(admin_id),  
foreign key(w_url) references onlinecart(w_url));
```

Table created.

MANAGES

```
SQL> create table manages(w_url varchar2(10),p_id number,primary key(w_url,p_id),  
foreign key(p_id) references p_category(p_id),  
foreign key(w_url) references onlinecart(w_url));
```

Table created.

CONTAINS

```
SQL> create table contains (p_id number,order_no number,primary key(p_id,order_no),  
foreign key(p_id) references products (p_id),  
foreign key(order_no) references orders (order_no));
```

Table created.

MAKES

```
SQL> create table makes (c_id varchar2(10),payment_id number,order_no number,primary key  
(c_id,payment_id,order_no),  
foreign key(c_id) references customers(c_id),  
foreign key(payment_id) references payment(payment_id),  
foreign key(order_no) references orders(order_no));
```

Table created.

VISITS

```
SQL> create table visits (cid varchar2(10),w_url varchar2(10),primary key(cid,w_url),  
foreign key(cid)references customers(cid),  
foreign key(w_url) references onlinecart(w_url));
```

Table created.

QUERIES

1. Find the customer's name, product id whose product price is 1000.

```
SQL> select c.cname,s.p_id from customers c,products p,p_category s where c.p_name=p.p_name
and p.p_id=s.p_id and p_price=1000;
```

CNAME	P_ID
-------	------

vani	123
------	-----

2. Find the price and product name whose product price is 1000.

```
SQL> select p.p_price,p.p_name from products p,p_category s where s.p_id=p.p_id and
p.p_price=1000;
```

P_PRICE	P_NAME
---------	--------

1000	rices
------	-------

3. Display all the product names and customer names from given relations.

```
SQL> select p.p_name,s.cname from products p left join customers s on p.p_name=s.p_name;
```

P_NAME	CNAME
--------	-------

rices	vani
-------	------

pulses	rani
--------	------

soaps	hani
-------	------

dress	earbod
-------	--------

4. Display all p_names and cname who have ordered items from products.

```
SQL> select p.p_name,s.cname from products p right join customers s on p.p_name=s.p_name;
```

P_NAME	CNAME
--------	-------

rices	vani
-------	------

pulses	rani
--------	------

soaps	hani
-------	------

5.Display the customer name and customer id whose bought rice.

SQL> select c.cid,c.cname,p.p_id,p.p_name from customers c,products p where p.p_price=1000;

CID CNAME P_ID P_NAME

c1 vani 123 rices

c2 rani 123 rices

c3 hani 123 rices

6.Write a query to display the names of products whose price is 123.

SQL> select p.p_name from customers p2 where p.p_name IN(select s.p_name from products s where p_id=123);

P_NAME

Rices

7.Display order dates whose orderamount is 1000.

SQL> select order_date from orders where order_amount=1000;

ORDER_DAT

12-JAN-23

create table onle(cid varchar2(3) primary key,foreign key(cid)references customers(cid)on delete cascade);

Table created.

SQL> desc onle

Name Null? Type

CID NOT NULL VARCHAR2(3)

8.Write a query to find the total count of products

SQL> select count(*) from products;

COUNT(*)

5

9. Write a query to find the average price of products

SQL> select avg(P_PRICE) from products;

```
AVG(P_PRICE)
-----
1400
```

10. Write a query to display all in products sort by p_id.

SQL> select * from products order by p_id;

P_NAME	P_PRICE	P_ID
earbod	1600	122
rices	1000	123
pulses	1200	124
soaps	1300	127
dress	1900	172

CONCLUSION

'Online Shopping' is intended to provide a web-based application that facilitates product searching, browsing, and selection. The search engine provides a quick and convenient way for users to search for products. The search engine would refine the offered products based on the user's input. The user can then view the entire product specification. They can also read the product reviews and leave their own. The use of components makes the application interactive and eliminates the need for unpleasant post backs. Its drag-and-drop feature would make it simple to use.

As we focus on the costs of online shopping, it seems that online shopping is really detrimental for the environment. Online shopping brings us great convenience, but it also encourages irresponsible consumption habits like exploiting the advantages of free returns and expedited shipping. These add on to the existing pool of environmental problems that we are dealing with – global warming, wastes and pollution. Therefore, we should change our attitude towards e-commerce – to be more responsible, less exploitative and more thoughtful for the environment.
